

Using the library branch data from **library-data.kml** (KML is XML-based so you can use XPath or DOM methods to query), create a form with a dropdown listing the library branch names. Selecting a library and clicking on the submit button will lead to a library page displaying branch data.

Requirements

On the home page (or other page) of your **Node** app, create a form which contains a dropdown and a submit button.

The form action leads to a library page.

The dropdown options have the library branch names as the displayed text. The option **value** attributes contain the library ID (Placemark **id** attribute).

On the individual library branch page, display the data.

Get the library branch ID from the submitted form data.

Using the ID, get the library branch (Placemark).

Display the following data on the page:

Branch name (as page title)

Library branch address

Phone number

Description

Zip your files and submit on Blackboard. This is an individual lab. Name your ZIP folder using the format below:

JLab4-JohnDoe.zip
